

# Chain Bag Dredge

The chain bag dredge is a robust instrument for collecting samples of loose rock, nodules or cobbles from the seafloor.

A ship has the dredge in tow and drags it across the seafloor, big rocks are collected in the chain bag whereas unconsolidated sediments are washed out.

As an option 4 sediment tubes can be mounted to the corners of the dredge's mouth.

Two types of chain bag dredges are available:

## Type I / Dredge K/MT 9000

Mouth: 500-950mm

Length: 1200mm

Weight: appr. 300kg

Material: steel

## Type II / Dredge K/MT 9001

Mouth: 950-1400mm

Length: 2000mm

Weight: appr. 500kg

Material: steel
